

Appendix: Bounded Artifact Review Notes

Bin Zhang

All file paths in this appendix are relative to the root of the public artifact repository.

This appendix summarizes the concrete artifact surfaces that bound the paper’s claims. It is reviewer-facing and intentionally limited to the bounded artifact surface used to support the TSE verification-boundary argument. The appendix does not add new evidence, new experiments, or new scenarios beyond the material already described in the main paper and the public artifact.

A. Public Artifact Baseline

The public artifact baseline for the present paper is the repository `joy7758/agent-evidence` at commit `80e7e78ab6cbd9befc24b56fbf9cdf99b5de`. The currently recorded artifact DOI is `10.5281/zenodo.19055948`. The paper’s bounded claims are tied to `Execution Evidence and Operation Accountability Profile v0.1` and its documented `validator/demo` path.

B. Artifact Entry Points Used By The Paper

The main manuscript relies on a small set of artifact entry points:

Purpose	Artifact file(s)
Profile definition	<code>spec/execution-evidence-operation-accountability-profile-v0.1.md</code>
Schema boundary	<code>schema/execution-evidence-operation-accountability-profile-v0.1.schema.json</code>
Example set overview	<code>examples/README.md</code>
Runnable demo overview	<code>demo/README.md</code>
Demo scenario	<code>demo/scenario.md</code>
Demo expected behavior	<code>demo/expected-output.md</code>
Validator regression coverage	<code>tests/test_operation_accountability_profile.py</code>

These files define the bounded evidence surface for the paper’s factual claims about object shape, validator behavior, controlled failure cases, and the single demo walkthrough.

C. Fresh Clean Rerun

A fresh local rerun was recorded on `2026-04-07` using Python `3.14.3` on macOS arm64. The minimal tested install path was the base editable install from the artifact repository root:

```
python3 -m venv .repro-v0_1-20260407-full
.repro-v0_1-20260407-full/bin/python -m pip install --upgrade pip
.repro-v0_1-20260407-full/bin/python -m pip install -e .
```

The rerun command list was:

```
.repro-v0_1-20260407-full/bin/agent-evidence validate-profile examples/minimal-valid-evidence.json
.repro-v0_1-20260407-full/bin/agent-evidence validate-profile examples/invalid-missing-required.json
.repro-v0_1-20260407-full/bin/agent-evidence validate-profile examples/invalid-unclosed-reference.json
.repro-v0_1-20260407-full/bin/agent-evidence validate-profile examples/invalid-policy-link-broken.json
.repro-v0_1-20260407-full/bin/python demo/run_operation_accountability_demo.py
```

The observed outcomes matched the bounded expectations already described by the artifact:

Command target	Observed exit	Bounded outcome
examples/minimal-valid-evidence.json	0	passing validation report with ok: true and issue_count: 0
examples/invalid-missing-required.json	1	primary error code schema_violation
examples/invalid-unclosed-reference.json	1	primary error code unresolved_output_ref
examples/invalid-policy-link-broken.json	1	primary error code unresolved_evidence_policy_ref
demo/run_operation_accountability_demo.py	0	final PASS summary line and emitted demo artifacts

This rerun supports a narrow claim only: the current minimal path can be re-executed cleanly and reproduces the documented pass/fail behavior for the controlled examples and the single demo walkthrough.

D. Controlled Example Set

The example set is intentionally small and role-specific:

Example file	Intended role	Main failure or success surface
examples/minimal-valid-evidence.json	valid profile specimen	full bounded pass
examples/invalid-missing-required.json	invalid specimen	schema failure
examples/invalid-unclosed-reference.json	invalid specimen	reference-closure failure
examples/invalid-policy-link-broken.json	invalid specimen	evidence-to-policy linkage failure

The purpose of this structure is not exhaustive rule coverage. It is to give a reviewer one passing specimen, three single-failure specimens, and one compact view of the current validator boundary.

E. Demo Boundary And Non-Goals

The demo is a single metadata-enrichment walkthrough over one source object under an explicit policy boundary. It is included to show that the current profile and validator path can close an end-to-end loop and emit reviewable artifacts. It is not presented as a benchmark, deployment study, or large-scale evaluation.

The same boundary applies to the paper as a whole. The contribution does not extend to registry design, multi-agent accountability composition, full FDO mapping, formal deployment assurance, or a complete cryptographic trust fabric.
